3 DIRECTIONS

MAIN PART

11. Band hip ER 01145

2 x	15	
Tue		
03/06		

12. Calf raise walk 02087

2 x	15	ES
Tue		
03/06		

13. Monster Walks 10035

2 x	15	
Tue		
03/06		

LATERAL MOSTER WALKS

14. Lateral lunge 01200

2 x	15	
Tue		
03/06		

16. Calf raise 03931

2 x	15	ES
Tue		
03/06		

15. Calf stretch 01207

2 x	15	
Tue		
03/06		

Arm swings 02880

Tips: Start with the legs approximately shoulder width apart & slightly flexed. Flex both arms in an alternating fashion & allow the elbows to flex at the end of the movement. Try to keep the arms close to the head & repeat the movements. Begin with smaller movements at a slow speed then gradually increase the range & speed as required.

Cautions: Do not force the arms too far back. Keep the arms & shoulders relaxed during the movements.

Band hip ER 01145

Tips: Start with the hips & shoulders square then externally rotate the hip. The amount of hip & knee flexion may vary depending on the requirements of the exercise. Try to keep the rest of the body stationary as the hip rotates.

Cautions: Keep the neck relaxed & control both phases of the movement.

Cable side lying hip abduction 04535

Tips: Secure the attachment around the lower leg & start with the body straight. Keeping the leg straight, abduct the hip for the prescribed range of movement then control the movement back to the start position. The height of the leg raise can vary depending on the requirements of the exercise.

Cautions: Ensure that the cable is securely attached to the ankle or lower leg. Do not force the movements in either direction.

Calf raise 03931

Tips: Start in a split stance with the knees aligned with the feet & the hips & shoulders square & facing forward. Keep the body in the same position & press up onto the balls of the front foot. Control the movement back to the start position. Press straight up onto the toes & do not invert or evert the foot.

Cautions: Do not round at the shoulders or flex the spine.

Calf raise walk 02087

Tips: Walk forwards in a very slow fashion with a natural heel to toe foot strike & press up onto the balls of the feet at the end of the stride. The feet should continue to face forward & maintain a natural stride length.

Cautions: If you have a history of ankle or foot injury, seek professional advice prior to commencing this

Calf stretch 01207

Tips: Sit with a tall posture with the strap securely around the ball of the foot. Keep the leg straight & actively dorsi flex the ankle joint as far as possible. At the end of active the dorsi flexion pull on the strap to further increase the stretch while maintaining the contraction. Hold the assisted stretch for a short period of time then relax the ankle & repeat the movements. A towel or belt may be used as an alternative to the stretching strap.

Cautions: Ensure that the strap is secure & do not force the stretch.

Calf stretch 02599

Tips: Start with the hands approximately shoulder width apart on the floor. The hips & shoulders should be square with the feet evenly apart. Push up onto the ball of the foot so the back leg is straight with the other leg flexed. Ensure that the hips & shoulders remain square & that the rear foot remains on the ground.

Cautions: Discontinue the stretch if pain or discomfort is experienced at the back of the thigh or the lower back. Relax the neck & shoulders while moving into position.

Deep squat 01211

Tips: Start with the elbows wide, the feet slightly wider than shoulder width & facing out. Perform a deep squat while maintaining an erect torso & keeping the feet flat on the ground. The knees should track in line with the centre of the feet. The range of motion for the squat may vary depending on strength & flexibility.

Cautions: Maintain neutral curves in the spine & do not pull the neck forward as the hands remain positioned behind the head.

Lateral lunge 01200

Tips: Maintain an upright torso & keep the hips & shoulders square during the lunges. The lead knee should track in line with the centre of the foot & keep the torso inside the vertical position of the lead knee. The length & depth of the lunge may vary depending on strength & flexibility levels. Hold a medicine ball or weight in front to increase the demand on the hip & torso muscles.

Cautions: Do not allow the lead knee to twist while in a deep lunge position.

Leg swings 01189

Tips: Hold onto an object for additional balance & start with the hips & shoulders facing forward. Maintain an upright posture & keep the leg relaxed during the swings. Gradually increasing the range of motion. Try to swing the leg straight through unless specified otherwise by an exercise professional.

Cautions: Warm up prior to commencing this exercise. Gradually increase the range of motion & the speed of the swings.

Leg swings 01191

3 DIRECTIONS

Tips: Hold onto an object for additional balance & start with the hips & shoulders facing forward. Maintain an upright posture & keep the leg straight & relaxed during the swings.

Cautions: Warm up prior to commencing this exercise. Gradually increase the range of motion & the speed of the swings.

Monster Walks 10035

LATERAL MONSTER WALKS

Tips:

Cautions:

Single leg bridging leg circles 01136

Tips: Keep the head & shoulder in contact with the ground raise the hips until the thighs are in line with the torso. Maintain a stable torso & move the unsupported leg in small circles. Vary the position of the hands on the floor depending on the amount of additional balance required.

Cautions: Do not extend the spine past neutral unless specified otherwise by an exercise professional.

Single Leg Glute Bridge - March 10053

Tips:
Cautions:

Spine rotation 01161

Tips: Maintain an upright posture with the arms wide for balance. Adjust the leg position as required to ensure optimal balance. Rotate the torso to both directions with small controlled bounces at the end of the rotations. The range of movement & the speed of the bounces may vary depending on the requirements of the exercise however keep the neck in line with the spine during both phases of the exercise.

Cautions: If you have a history of spinal injury or other spinal pathologies, seek professional advice prior to commencing this exercise.

Straight leg leg raise 03390

Tips: Take a firm grip on the bar above the head with the head, shoulders & hips supported. Keeping the legs straight, flex the hips to approximately 90 degrees then lower the legs back to the start position. The total range of motion will be determined by the strength of the abdominal muscles & by flexibility of the hamstrings & hips. Place a medicine ball between the knees or feet to increase the resistance for this exercise.

Cautions: Control both phases of the exercise. Do not allow the spine to extend as the legs return to the start position.
